

Established lawns and landscapes need **only about an inch** of water each week in temperate climates.

Adjust the timer on your sprinkler system and save up to thousands of gallons of water while keeping grass, plants and trees healthy.

Follow local watering guidelines and restrictions, and plan to water every two or three days. On watering days:

- Set the run time for a zone of spray heads to just 12 to 20 minutes.
- Set a zone of rotors to run for only 25 to 40 minutes.
- Divide the run time into three or four cycles so each water application is fully absorbed.
- Turn your sprinkler system off (or install a rain sensor that does it automatically) when you get enough rain to soak the soil.
